APPLICANT: Heinrich-Pette-Institut
TITLE OF INVENTION: Retroviral hybrid vectors pseudotyped with LCMV
FILE REFERENCE: p50489
CURRENT APPLICATION NUMBER: US/09/309,572
CURRENT FILING DATE: 1999-05-11
EARLIER APPLICATION NUMBER: DE 198 56 463
EARLIER FILING DATE: 1998-11-26
NUMBER OF SEQ ID NOS: 24
SOFTWARE: Patentin Ver. 2.0
EQ ID NO 16
LENGTH: 500
TYPE: PRT
ORGANISM: Human immunodeficiency virus type 1
FEATURE:
OTHER INFORMATION: gag polyprotein

Patent No. 5556757

GENERAL INFORMATION:
APPLICANT: VAN ALSTYNE, Diane
APPLICANT: SHARMA, Lawrence Rajendra
TITLE OF INVENTION: PEPTIDES REPRESENTING EPITOPIC SITES FOR
TITLE OF INVENTION: BACTERIAL AND VIRAL MENINGITIS CAUSING AG
TITLE OF INVENTION: CNS CARRIER, ANTIBODIES THERETO, AND USES
NUMBER OF SEQUENCES: 40
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                         CACATCGCCCGCAACTGCCGCGCCCCCCCGCAAGAAGGGCTGCTGGAAGTGCGGCAAGGAG

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Synthetic Env and Gag expression cassettes exhibit increased potency for induction of cytotoxic T-lymphocyte (CTL) responses by DNA immunization. Gag of HIV-1 self-assemble into non-infectious virus-like particles which are used as a matrix for the proper presentation of an antigen entrapped or associated to the immune system of the host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 492

                                                                                                                                                                                                                                                                                  US-09-475-704A-3 (1-1479) x AAE37600
                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to molecules comprising HIV-1 subtype isolate regulatory/accessory genes (tat, nef and rev genes) and modifications and derivatives thereof. The invention also provides proteins encoded by such genes. Sequences of the invention are useful for manufacturing vaccines for treating or preventing human immunodeficiency virus (HIV) infections.
                                                                                                                                                                                                                                                                                                                                                                               For treating or preventing human immunodeficiency virus (HIV) infect
They are also useful in gene therapy. The present sequence is HIV-1
subtype C isolate Du422 Gag protein. (Updated on 23-OCT-2003 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a vector including a nucleotide sequence encoding an HIV Gag polypeptide, where the nucleotide sequence encoding the Gag polypeptide comprises a sequence having at least 90% sequence identity to 1549 (S1) or 1479 (S2) bp defined in the specification. The vector is useful as a vaccine for the treatment or prophylaxis of HIV infection in a mammal, where the vaccine induces an immunogenic response to the virus-like particles in a suitable susceptible host. This sequence corresponds to an HIV-1 gag protein sequence used in the method of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             र्
                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a vector including a nucleotide sequence encoding an HIV Gag polypeptide, where the nucleotide sequence encoding the Gag polypeptide comprises a sequence having at least 90% sequence identity to 1549 (S1) or 1479 (S2) bp defined in the specification. The vector is useful as a vaccine for the treatment or prophylaxis of HIV infection in a mammal, where the vaccine induces an immunogenic response to the virus-like particles in a suitable susceptible host. This sequence corresponds to an HIV-1 gag protein sequence used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Wild type HIV-1 gag

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              15-JUL-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ADN36396
                                                                                                                                                                                                 le invention relates to a nucleic acid vector comprising at least one IV sequence operably linked to a promoter and encoding a protein that les not assemble into viral particles. The nucleic acid vector is useful immunizing a subject against HIV infection. This sequence corresponds a peptide used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1438

The invention relates to a composition comprising isolated nucleic acids encoding env, gag or pol gene product of human immunodeficiency virus or immunogenic fragment of the gene products. The gag gene product is modified to inhibit formation of virus-like particles containing gag gene product and their release from cells, and the pol gene product is modified to inhibit reverse transcriptase activity. The invention also relates to a method for producing an alpha-virus replicon particle used in vaccines. The composition is useful for inducing an immune response to human immunodeficiency virus (HIV) or for treating or preventing HIV infection in a subject. The alpha-virus replicon particle is useful in a

The composition is useful for administering a protein or peptide to a subject. A composition comprising heparin affinity-purified alphavirus replicon particle is useful as a clinical trial material and as a commercial product. The present sequence is HIV-1 Clade C gag protein.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a process for the selection of human immunodeficiency virus (HIV) subtype isolates for use in the development of a prophylactic and/or therapeutic pharmaceutical composition. The process involves selecting isolated virus or viruses with a high sequence identity to a consensus sequence and a phenotype which is associated with transmission for the particular HIV subtype. The composition can be used in the production of vaccines against HIV. The present sequence is the HIV-1 subtype C isolate Du422 gag protein. (Updated on 29-AUG-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Selecting HIV-1 subtype C isolates, which are useful in developing vaccines against HIV infection, comprises isolating viruses with high sequence identity to a consensus sequence whose phenotype is associate with the HIV subtype.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel method of determining whether a compound inhibits formation of a complex between HIV nucleocapsid protein 7 (NCp7) polypeptide and an HIV-psi-site oligonucleotide. The method involves adding the HIV-psi-site oligo to a mixture of the NCp7 polypeptide and the novel compound and comparing amount of complex formed, with that formed in the absence of the compound, where a decrease in the amount of complex formed in presence of the compound indicates that the compound inhibits complex formation. The method of the invention involves anti-HIV activity. The compounds identified are useful for treating a subject infected with human immunodeficiency virus (HIV) by administering the compound to the subject. This sequence represents an HIV-1 gag protein which contains an NCp sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Method of determining whether a compound inhibits formation of complex between HIV nucleocapsid protein 7 polypeptide and HIV psi-site oligonucleotide by comparing amount of complex formed in presence/absence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        뮹
                                                                                                                                                                                                                                                                                                         The invention relates to a nucleic acid vector comprising at least one HIV sequence operably linked to a promoter and encoding a protein that does not assemble into viral particles. The nucleic acid vector is useful in immunizing a subject against HIV infection. This sequence corresponds to a peptide used in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid vector comprising at least one HIV sequence operably linked to a promoter and encoding a protein that does not assemble into viral particles, useful in immunizing a subject against HIV infection.

Method of determining whether a compound inhibits formation of complex between HIV nucleocapsid protein 7 polypeptide and HIV psi-site oligonucleotide by comparing amount of complex formed in presence/abserof compound. presence/absence

Claim SEQ ID NO 105pp; English.

The invention relates to a novel method of determining whether a compound inhibits formation of a complex between HIV nucleocapsid protein 7 (NCp7) polypeptide and an HIV-psi-site oligonucleotide. The method involves adding the HIV-psi-site oligo to a mixture of the NCp7 polypeptide and the novel compound and comparing amount of complex formed, with that formed in the absence of the compound, where a decrease in the amount of complex formed in presence of the compound indicates that the compound inhibits complex formation. The method of the invention involves anti-HIV activity. The compounds identified are useful for treating a subject infected with human immunodeficiency virus (HIV) by administering the compound to the subject. This sequence represents an HIV-1 gag protein which contains an NCp sequence of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              number of human immunodeficiency virus (HIV) type 1 non-subtype B isolates. The sequences shown include the near full-length coding sequences from each isolate, and the env, pol, vif, vpr, vpu, gag, tat, rev and nef proteins. These can be used to detect the presence of HIV-1 in a sample and to produce antibodies against non-subtype B HIV-1 virus. These antibodies can be used in vaccines to prevent and treat HIV infection. The method involves adding the HIV-psi-site oligo to a mixture of the NCp7 polypeptide and the novel compound and comparing amount of complex formed, with that formed in the absence of the compound, where a decrease in the amount of complex formed in presence of the compound indicates that the compound inhibits complex formation. The method of the invention involves anti-HIV activity. The compounds identified are useful for treating a subject infected with human immunodeficiency virus (HIV) by administering the compound to the subject. This sequence represents an HIV-1 gag protein which contains an NCp sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Method of determining whether a compound inhibits formation of complex between HIV nucleocapsid protein 7 polypeptide and HIV psi-site oligonucleotide by comparing amount of complex formed in presence/absence of compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI;

                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel method of determining whether a compound inhibits formation of a complex between HIV nucleocapsid protein 7 (NCp7) polypeptide and an HIV-psi-site oligonucleotide. The method involves adding the HIV-psi-site oligo to a mixture of the NCp7 polypeptide and the novel compound and comparing amount of complex formed, with that formed in the absence of the compound, where a decrease in the amount of complex formed in presence of the compound indicates that the compound inhibits complex formation. The method of the invention involves anti-HIV activity. The compounds identified are useful for treating a subject infected with human immunodeficiency virus (HIV) by administering the compound to the subject. This sequence represents an HIV-1 gag protein which contains an NCp sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Method of determining whether a compound inhibits formation of complex between HIV nucleocapsid protein 7 polypeptide and HIV psi-site oligonucleotide by comparing amount of complex formed in presence/absence of compound.

                                                                                                                                                                                                                                                                                                              The present in invention provides the protein and coding sequences for a number of human immunodeficiency virus (HIV) type 1 non-subtype B isolates. The sequences shown include the near full-length coding sequences from each isolate, and the env, pol, vif, vpr, vpu, gag, tat, rev and nef proteins. These can be used to detect the presence of HIV-1 in a sample and to produce antibodies against non-subtype B HIV-1 virus. These antibodies can be used in vaccines to prevent and treat HIV infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ś
                                                                                                       The invention relates to a novel method of determining whether a compound inhibits formation of a complex between HIV nucleocapsid protein 7 (NCp7) polypeptide and an HIV-psi-site oligonucleotide. The method involves adding the HIV-psi-site oligo to a mixture of the NCp7 polypeptide and the novel compound and comparing amount of complex formed, with that formed in the absence of the compound, where a decrease in the amount of complex formed in presence of the compound indicates that the compound inhibits complex formation. The method of the invention involves anti-HIV activity. The compounds identified are useful for treating a subject infected with human immunodeficiency virus (HIV) by administering the compound to the subject. This sequence represents an HIV-1 gag protein which contains an NCp sequence of the invention.
                                                                                                                                                                                                                                                     Claim
                                                                                                                                                                                                                                                                           between HIV nucl oligonucleotide of compound.
